

OpenOncology — Pathology / Biopsy Report (TEST FIXTURE)

Synthetic record generated for local submission-flow testing only. Not a real patient.

Patient Alias	TESTFIX-KRAS-G12C-01
Specimen	Core needle biopsy, right upper lobe lung lesion
Collection Date	2026-07-14
Report Date	2026-07-16
Referring Diagnosis	Non-Small Cell Lung Cancer (Adenocarcinoma)
Ordering Physician	Dr. A. Reyes, Pulmonology (test fixture)

Gross Description

Received in formalin, three cores of tan-white tissue, aggregate size 1.4 x 0.3 x 0.3 cm. Entirely submitted in one cassette.

Histopathology Summary

Malignant epithelial neoplasm consistent with adenocarcinoma, acinar-predominant pattern. Moderate nuclear atypia with gland-forming architecture and focal mucin production. Tumor cellularity estimated at approximately 60%. No definitive lymphovascular invasion identified on the submitted sections.

Immunohistochemistry (IHC)

Marker	Result
TTF-1	Positive
Napsin A	Positive
p40	Negative
PD-L1 (TPS)	30%

Clinical Notes

Specimen forwarded for molecular profiling and somatic variant interpretation. Accompanying DNA sequencing submission (dna_sample_kras_g12c.vcf) identifies a pathogenic KRAS p.Gly12Cys (c.34G>T) variant at chr12:25398284 (GRCh38), consistent with a well-characterised actionable driver in lung adenocarcinoma. Recommend correlation with targeted therapy planning per current NCCN guidance.

This is a synthetic test biopsy file generated for local platform validation only. It does not describe a real patient, specimen, or diagnosis.
